ABSTRACT

invention relates to The present а power belt including an elastomeric transmission striated 5 matrix (21) and lengthwise supporting structure a consisting of polyamide 4.6 twisted strands (20). The supporting structure (21) is selected so that the stresselongation diagram of the belt exhibits an average slope ranging from 12 to 20 daN/% of elongation per width 10 centimeter. The twisted strands are wound with an almost null nominal tension, and the curing operation and the cooling operation after curing are carried out without any belt tensioning.
